

The SKYLIGHT clinical study: What you should know

The SKYLIGHT clinical study will test a non-hormonal, investigational drug for hot flashes. By taking part, you could help researchers learn whether the drug may reduce hot flash symptoms.

The study is for postmenopausal women who:

Are aged 40-65

Have frequent, moderate to severe hot flashes
(7 or more times per 24-hour period)

Are seeking a non-hormonal therapy option

Here's what you should know if you are interested in taking part:

-  The study doctor will determine whether you are eligible
-  The study may last for up to 13 months
-  You may need to make 1-2 trips per month to the study location
-  The study involves taking pills (active or placebo*) by mouth once or twice daily
-  Tests, including blood tests, will be done at various times throughout the study[†]
-  You do not have to stay in the study, and can stop anytime, for any reason

*Placebo=Something that looks like the drug but does not contain any drug.

[†]Tests for this study will be done at no cost to you.

This drug is experimental.

Because of that, not all risks are known before starting a study.
